the humanized heavy chain comprising three complementarity determining regions (CDR1, CDR2 and CDR3) having amino acid sequences from the corresponding complementarity determining regions of [a] the mouse 21-6 immunoglobulin heavy chain <u>variable domain designated SEQ. ID. No. 4</u>, and a variable region framework from a human heavy chain variable region framework sequence except in at least one position selected from a second group consisting of H27, H28, H29, H30, H44, H71, wherein the amino acid position is occupied by the same amino acid present in the equivalent position of the mouse 21-6 immunoglobulin heavy chain variable region framework;

wherein the <u>humanized</u> immunoglobulin specifically binds to [a] VLA-4 [ligand] with a binding affinity having a lower limit of about 10<sup>7</sup> M<sup>-1</sup> and an upper limit of about five-times the binding affinity of the mouse 21-6 immunoglobulin.

- 17. (Amended) An antigen-specific binding fragment of the humanized immunoglobulin of claim 14 or claim 16.
- 22. (Amended) A nucleic acid encoding a heavy chain of a humanized antibody of claim 1 or an antigen-specific binding fragment thereof.
- 23. A nucleic acid encoding a light chain of a (Amended) humanized antibody of claim 1 or an antigen-specific binding fragment thereof.
- (Amended) An apparatus comprising a [A] computer programmed to display a three-dimensional representation of a humanized immunoglobulin of claim 1 on a monitor.
- 26. (Amended) A method for detecting VLA-4 antigen, the method comprising:

administering a humanized immunoglobulin of claim 14 or 16, or an antigen-specific binding fragment thereof, to [a patient or] a tissue sample [therefrom] from a patient; and
